Essential Stationary Sash and Leveling Block
Field Applied Replacement Instruction

This instruction can be used for Essential Picture, Transom and Glider XO/OX and XOX units. For XOX units repeat steps for multiple operator panels and components.

### Stationary Sash Parting Stop Kits

<table>
<thead>
<tr>
<th>1 - XOX parting stop</th>
<th>2 - XO/OX parting stops</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 - Picture/Transom parting stops</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** New parting stops should be ordered and used when replacing any components that require the removal or installation of the stationary sash. (New stationary sash and frames will include new parting stops).

### Sash Replacement Kit

| 1 - Replacement sash | 2 - 7/8" flat head stainless steel (SS) screws |

### Leveling Block Replacement Kits

<td>1 or 2 End Caps (Glider)</td>
</tr>
</tbody>
</table>

### You Will Need to Supply

- Safety glasses
- 1" wide wood chisel
- Clear or white sealant
- Phillips head screwdriver
- Stationary sash removal tool (or) 2 - flexible putty knives for removing pre-March 2009 sash.

- Leveling Block Replacement ....................... 4

### Stationary Sash Removal

1. For picture and transom units proceed to step 2.
   - Remove the operator sash. Slide the sash away from the jamb a few inches, engage the tilt latches and tilt sash to the interior. Lift the sash off the sill and set aside. See figure 1.

2. Using a stiff putty knife or chisel, remove and discard the head jamb parting stop. See figure 2. Remove the jamb parting stop in the same manner and discard. Remove and save the sill liner on picture and transom units. For picture and transom units, proceed to 6.

3. Partially remove the head jamb weather strip at the meeting stile area. Do the same for the sill weather strip. See figure 3.
4. Use a Phillips head screwdriver to remove the leveling block end cap screw. See figure 4.

![Figure 4](image)

5. Remove the head jamb bracket screw and set aside for reuse. See figure 5.

![Figure 5](image)

**NOTE:** Refer to steps 5 and 6 of the included retrofit instructions for units manufactured prior to March 2009.

6. Pry up between the stationary sash and header and pull top edge of sash inward. See figure 6.

![Figure 6](image)

7. Once the stationary sash is tilted to the interior, start at one end and lift the sash off the sill. The barb on the leveling block will disengage from the kerf in the sill. A putty knife may be necessary to help disengage the end cap from the sill on gliders. See figure 7.

![Figure 7](image)

**Stationary Sash Installation**

**NOTE:** If completely replacing the existing stationary sash with a new one shipped from factory, proceed to step 1 for gliders and step 2 for pictures/transoms. If you are only replacing the frame on a glider manufactured prior to April 2011, or replacing the leveling block on a Picture/Transom unit, see **Leveling Block Replacement** on page 4 before proceeding to step 1 or 2.

**NOTE:** If replacing the frame only on gliders manufactured prior to March 23, 2009, refer to other set of included instructions for retrofitting the stationary sash before reinstalling into the new frame.

1. Clear debris and old sealant from the kerf around the old end cap screw hole. Inject sufficient sealant to completely seal and fill the existing end cap screw hole in the sill. White or clear colored general purpose sealant is recommended for visual purposes. Wipe away excess sealant after installation is complete. See figure 8.

![Figure 8](image)

- Video clip of installing stationary sash
2. Lift the new stationary sash into place. For XO and OX units, keep the new stationary panel close to the jamb, set it on the sill so that the barb on the leveling block fits into the kerf in the sill. Tilt the sash into place. For XO and XO gliders ensure that the sash is slid tight up against the side jamb. See figure 9. For picture and transom units, proceed to step 6.

3. Position the glider header bracket under the Euro Groove block in the header. Insert the truss head screw from the old sash back through the header bracket and into the hole in the Euro Groove block. See figure 10.

NOTE: Insert the header and sill weather strip on XOX units before proceeding to the next step. This will help position the stationary sash in the correct location prior to installing the header bracket.

3. Position the glider header bracket under the Euro Groove block in the header. Insert the truss head screw from the old sash back through the header bracket and into the hole in the Euro Groove block. See figure 10.

NOTE: If reinstalling the sash into a glider frame manufactured prior to March 2009, simply reinsert sash peg into bracket.

4. Inject a small amount of sealant into the hole in the leveling block end cap. See figure 11.

5. Drive the supplied flat head stainless steel screw through the hole and down into the sill kerf until the head is flush with the end cap. See figure 12. Be careful not to strip out the screw. Wipe away excess sealant.

6. Replace the head jamb weather strip on OX and XO units followed by the sill weather strip making sure that the weather strip butts up tight against the end cap(s). Lastly, insert the new sash stops starting with the head jamb first, then the jamb. For gliders, replace the white sash stop(s). For pictures/transoms, replace the sill liner.

7. Replace operator sash on gliders.

NOTE: Confirm location of the stationary sash on XOX units by measuring the distance from each jamb and making sure they are equal.
Leveling Block Replacement

1. First remove the stationary sash per the enclosed stationary sash removal instructions.

2. Remove and discard the existing leveling block (and end cap(s) for gliders). Depending on the style of leveling block removal will vary. Units built after April 2010 can have leveling block removed by simply removing the screws located in the underside of the leveling block. See figure 13.

3. The other style of leveling block can be removed by sliding it out of the bottom rail. It may be necessary to make slight notches with your knife in the sash stile to allow the leveling block to slide out. See figure 14. For picture and transom units, proceed to step 5.

4. Attach the dust block to the end cap and insert the end cap in the end of the leveling block. See figure 15.

5. Fasten the leveling block to the bottom corners of the sash with 3/4" pan head screws. See figure 16. Proceed to the following step for picture/transom units.

6. Picture and transom units require a third 3/4" pan head screw to be installed through the leveling block at the center of the sash. See figure 17.

7. Install the stationary sash per the enclosed stationary sash installation instructions.
